

F1 Race Strategy Intelligence Platform Report

The Problem?

- F1 is at the center of data and speed. Analysing huge loads of data in a matter of split seconds and win you the race or lose it. Pitstops, compound choice - everything plays an insanely huge role. So, completely understanding and analysing all the data available is the key.
- Analysis also depends on a ton of historical data and calculations as well.

The Users

- Racing teams who are responsible for strategy and split second choice heavily rely on our system. F1 analysts use data to understand trends in tyre choices, weather conditions etc.

What Success Looks Like?

- Correctly predicting weather conditions
- Correctly calculating gaps to drivers and tire wear
- Correctly predicting opponent drivers pit-stops based on tire wear
- What strategy predicted vs race results

Questions the Tool will Answer

- Which drivers were able to manage tire conditions with pace?
- How fast does each compound degrade?
- Did undercut/overcut payoff?
- Did we correctly predict opponents' one stop, two stop strategy?
- When was the most optimal pit window?

Phase 1

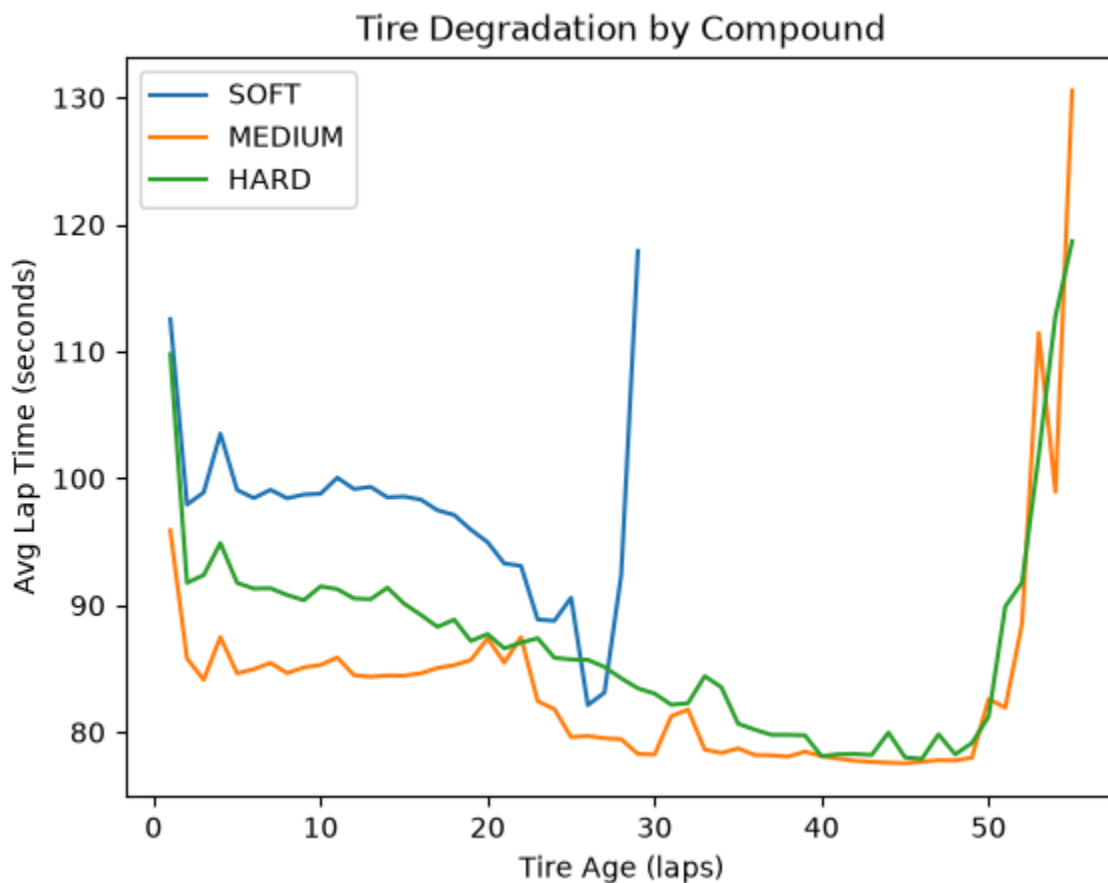

Image 1 - Tire Degradation by Compound: Shows how avg lap times goes up as tire age increases for soft, medium and hard tires
