

Phase 5: Product Roadmap

Feature Backlog & RICE Roadmap

RICE = (Reach × Impact × Confidence) ÷ Effort. Higher the score, higher the priority.

Scale used:

- **Reach** (1-10): how many use cases this touches
- **Impact** (1-3): 3 = massive, 2 = high, 1 = medium
- **Confidence** (%): how sure I am the reach/impact estimates are right
- **Effort** (person-weeks): rough build time at my skill level, working solo

1. Real Time Race Mode: Live timing feed during an actual race weekend instead of historical data.

- **Reach: 9** - the feature every strategist would use constantly during every race
- **Impact: 3** - changes the tool from 'post-race analysis' to 'decision support during race' - the actual use case of F1
- **Confidence: 30%** - FastF1's live timing support is unreliable during live sessions. Uncertain whether this can be achieved with free tier API
- **Effort: 6 weeks** - requires learning a new data pipeline, handling streaming data and most likely needs a paid API upgrade
- **RICE = $(9 \times 3 \times 0.3) \div 6 = 1.35$**

2. Weather / Track Temperature Integration: Correlate the track/air temperature with degradation rates.

- **Reach: 6** - enhancement only. doesn't create a new use case
- **Impact: 2** - improves accuracy of degradation predictions
- **Confidence: 70%** - FastF1 does give weather data per session, so this is a known, buildable addition
- **Effort: 1.5 weeks** - mostly a join + a new chart, using data I already have access to
- **RICE = $(6 \times 2 \times 0.7) \div 1.5 = 5.6$**

3. ML Pit Window Predictor: A model that predicts the optimal pit lap given live degradation data.

- **Reach: 7** - 'decision support' core of the whole product
- **Impact: 3** - most valuable prediction a strategist could get
- **Confidence: 25%** - need to learn basic regression/ML, validate it against real outcomes, and also simple models can be misleading with limited race samples

- **Effort: 5 weeks** - basic ML and validation work to trust the output
- **RICE = $(7 \times 3 \times 0.25) \div 5 = 1.05$**

4. Multi Season Benchmarking: Compare degradation/strategy patterns across 2021–2024 instead of one season.

- **Reach: 5** - adds value for deeper analysis but not a daily use feature
- **Impact: 2** - adds credibility to insights
- **Confidence: 80%** - FastF1 supports historical seasons; mostly involves pulling more data
- **Effort: 1 week** - extending my existing data pipeline to more races/seasons
- **RICE = $(5 \times 2 \times 0.8) \div 1 = 8.0$**

5. Competitor Strategy Comparison: How did Team A's strategy differ from Team B's?

- **Reach: 6** - useful for comparing strategy with alternatives to maximize results.
- **Impact: 2** - clear and useful insight
- **Confidence: 65%** - buildable with data I already have (Stint, Compound, LapTime by team) but needs a new dashboard view
- **Effort: 1 week** - mostly Power BI, very little new Python
- **RICE = $(6 \times 2 \times 0.65) \div 1 = 7.8$**

6. Undercut/Overcut Simulator: Simulate pitting a lap earlier/later and estimate the time impact.

- **Reach: 6** - interactive feature that shows strategic reasoning
- **Impact: 3** - close to the actual decision a strategist makes during a race
- **Confidence: 45%** - the math is learnable but making it interactive is more building than I've done so far
- **Effort: 2.5 weeks** - logic is an extension of existing work. Sliders or inputs is new
- **RICE = $(6 \times 3 \times 0.45) \div 2.5 = 3.24$**

7. Driver Tire Management Leaderboard: A ranked, published leaderboard about who manages tires best relative to pace across drivers and seasons.

- **Reach: 7** - highly shareable, and I already have the analysis
 - **Impact: 2** - good differentiator content but not core product value
 - **Confidence: 85%** - I've already built the core; mostly presentation and polishing
 - **Effort: 0.5 weeks** - smallest effort on this list since the analysis exists
 - **RICE = $(7 \times 2 \times 0.85) \div 0.5 = 23.8$**
-

Rank	Feature	RICE Score
1	Driver Tire Management Leaderboard	23.8
2	Multi Season Benchmarking	8.0
3	Competitor Strategy Comparison	7.8
4	Weather / Track Temp Integration	5.6
5	Undercut/Overcut Simulator	3.24
6	Real Time Race Mode	1.35
7	ML Pit Window Predictor	1.05

The two features that sound the most exciting (real time mode and an ML predictor) score lowest. Not because they're bad ideas but because they carry the highest uncertainty and cost relative to whats already known. The leaderboard scores highest specifically because I've already derisked it. The analytical work is done so effort is low and confidence is high.

Now / Next / Later Roadmap

NOW (next 2-4 weeks)

- **Driver Tire Management Leaderboard** - highest RICE, lowest effort and it directly extends Phase 3 work I've already done.
- **Multi Season Benchmarking** - second highest RICE, low effort uses my existing pipeline on more data.

NEXT (2-3 months):

- **Competitor Strategy Comparison** - adds value, moderate effort, extension of my dashboard.
- **Weather / Track Temp Integration** - enhances existing analysis, buildable once core phases are done.

LATER (3+ months):

- **Undercut/Overcut Simulator** - genuinely cool, but interactivity is a big lift.
- **Real Time Race Mode** - the 'dream feature' but blocked by data access uncertainty,
- **ML Pit Window Predictor** - needs ML and real validation before it will be trustworthy.
